

ABSTRACT OF THE DISCLOSURE

The completion of an electronic checklist is facilitated by the automated display of certain data while completing the checklist. The disclosed program presents an automated display of synoptic, navigational, or flight management data for each task in a checklist. For each task in a checklist, there may be certain data which would aid the pilot or other user to complete the checklist. Such data can be displayed contemporaneously with the checklist. After the completion of each task in the checklist, the contents of the display can be restored to the state the display was in before the checklist was started.
